

Security Information & Event Management

Super-Size Your Visibility With SIEM

DATA SHEET

OVERVIEW

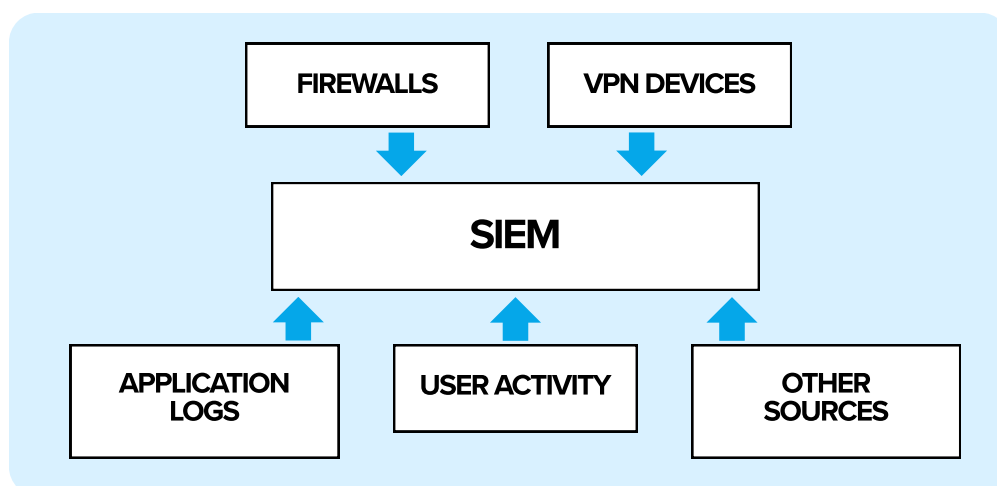

SIEM, or Security Information & Event Management is a process of collecting event logs relating to all traffic and activity from every server, endpoint, firewall, switches, access points and cloud platforms to allow a security operations team to gain a true picture of what is happening on your network and identify malicious activity. That is a lot of data!

SIEM is fast becoming the gold-standard in security operations to provide actionable insights in the fight against cyber breaches, so much so that many insurance companies and supply chains now mandate that this level of protection is in place across businesses.

Urban Network's SIEM service integrates directly into the same security operations team that are already protecting your systems via our Managed Detection & Response services, this valuable insight gives them super-powers to help defend your systems, data and identities. Visibility is everything, you can't protect what you can't see.

KEY SERVICE HIGHLIGHTS

This diagram shows how a SIEM platform centralises data from firewalls, VPNs, applications, and user activity to deliver real-time visibility and security monitoring across the IT environment.

Key Benefits

- **Enterprise visibility:** Gain complete security insight across all logs, endpoints, and cloud services
- **Faster threat response:** Reduce the time it takes to find and respond to threats
- **Stronger protection:** Build a reliable security setup that works well with your existing tools
- **Better security operations:** Reduce false alerts so your team can focus on real risks
- **Always ready for audits:** Meet key compliance standards with confidence

The Potential Impact To Your Business

Running your business without a modern SIEM makes it harder to stay on top of security. The impact adds up very quickly which starts to affect trust, reputation, and cost. Relying on an overstretched team to oversee all aspects of your infrastructure & security 24/7 is not a plan, it is a risk.

Check out the statistics below to see the real impact:

Consequence	The Hard Data	Implication For Your Business
Financial Impact	The average data breach costs £3.5 million	Every delay increases the size of the loss you're exposed to
Operational Blindness	70% of ransomware attacks are discovered by third parties—not internal teams	Critical attacks may already be happening without your knowledge
Attacker Advantage	Organisations take an average of 8 days to detect intrusions	Attackers have nearly two full working weeks to move laterally, steal data, and lock in persistence
Compliance Exposure	Regulatory fines can reach millions, with GDPR penalties up to £17 million or 4% of global turnover	Without audit-ready logs, compliance failure becomes a near certainty

For your business, adopting SIEM means:

- **Less overload:** Help your team focus on real threats instead of too many alerts and tools.
- **Proven results:** 85% of organisations say this improves how they find and respond to threats.
- **Ready to grow:** More businesses are moving to cloud-based security, and use is rising quickly.
- **Faster fixes:** Combining security tools helps organisations find and fix issues much faster.
